

Cross-method directional convergence

Reference-state aerodynamic inference

$$\Delta C_{D,\text{ref}} = +0.00938487$$

$$\Delta D_{\text{ref}} = 1.28247 \text{ N}$$

Positive in held-out evaluation
and all required sensitivities

POSITIVE DIRECTION

Support-aware nonlinear surrogate

$$\Delta D_{\text{cf}} = 1.01826 \text{ N}$$

95% CI 0.97612-1.06226 N

24/24 pair means positive
within shared empirical support

POSITIVE DIRECTION

Aero-propulsive force balance

$$\widetilde{\Delta D} = 0.83568 \text{ N}$$

95% CI 0.69191-1.25995 N

$\mathcal{R}_+ = 1$
under both
propulsion specifications

POSITIVE DIRECTION

Common result: direction is positive across distinct estimands; numerical magnitudes are not pooled.

Methodological convergence within one campaign is not independent experimental replication.
